

Hello user! Thank you for using our interactive United States Population + Air Quality map. In this map, much information can be learned about Air Quality (measured via the air quality index) within the continental United States. There are many built-in features that support this, such as the time slider, layer toggle box, and twinned view pane. Additionally, the ability to zoom in and hover over specific AQI data collection sites allows for information such as the main pollutant to be seen. Overall the goal of this map is to inform the average US citizen about AQI over time, and potential drivers of pollutants so that they feel empowered to discuss with their governmental representatives if needed.
